

New build hydrogen ready power plant concept

Starting with natural gas today means preparing for tomorrow

Hydrogen readiness is key to new combined cycle power plants (CCPPs), when they do not require immediate Hydrogen operation now. An optimized H₂-Ready concept can reduce future retrofit costs, while keeping front-end investments low. Hydrogen use ensures a seamless transition away from natural gas. An H₂-Ready certificate from a neutral third party validates that your money is safely invested to avoid a stranded asset in the future.
