Siemens innovative 3D optimized turbine blades and vanes for SGT5-2000E and SGT6-2000E stages 1 and 2

The worldwide demand for electricity is growing continuously. At the same time an ever rising number of new regulations and laws demand environment-friendly technologies. Siemens is constantly developing new power plant technologies responding to today’s mega trends. Siemens gas turbines are renowned for their high availability and reliability as well as high power output and high efficiency with low emissions.

One of the innovative solutions offered by Siemens to help you improve your operating plant competitiveness and profitability are the Siemens innovative 3D optimized blades and vanes for the turbine stages 1 and 2.

Our product
Siemens innovative 3D optimized turbine blades and vanes are characterized by an aerodynamic blade and vane designed to optimize efficiency and to be retrofitted during service life. This generation of turbine stages 1 and 2 blades and vanes has a new, optimized aerodynamic airfoil designed with enhanced material, coatings, an improved cooling air path and a reduction of parasitic losses.

Customer benefits
Siemens innovative 3D optimized turbine blades and vanes for stages 1 and 2 can include the following benefits:
- Increased gas turbine power up to 5 MW*)
- Increased gas turbine efficiency up to 0.8 percentage point*)
- Reduced life cycle costs
- Compatible with the Siemens 41,000 equivalent operating hours (EOH) scheduled maintenance concept upgrade

The Siemens innovative 3D optimized turbine blades and vanes for stages 1 and 2 are state-of-the-art for new Siemens gas turbines of the SGT5-2000E (V94.2) since July 2008 and are also applicable for the SGT6-2000E (V84.2) frames.

For the SGT5-2000E (V94.2) frame the Siemens innovative 3D optimized turbine blades and vanes are also available for the stages 3 and 4.

Scope of supply
The Siemens innovative 3D optimized blades and vanes for the turbine stages 1 and 2 are just one of the many innovative modernization packages available.
The scope of this modernization includes the following new designed profiles and additional turbine parts:

- Turbine vane 1 (including riffle seals)
- Turbine blade 1
- Turbine vane 2 (including riffle seals and U-shaped seal ring segments)
- Turbine blade 2
- Cooling air throttle for vane 2
- Control optimization of the corrected turbine outlet temperature

The upgrade includes a machining of the turbine vane carrier in vane 2 section inserting the cooling air throttle. The Siemens innovative 3D optimized turbine blades and vanes can potentially be implemented in a row-by-row replacement. According to Siemens’ recommended maintenance schedule a major outage for the installation of this modernization is estimated. We offer a full range of field service capabilities to help you manage your maintenance and outage schedules.

References
More than 30 units are in operation worldwide with the Siemens innovative 3D optimized blades and vanes for the turbine stages 1 and 2.**

18 units of frame type SGT5-2000E (V94.2) have been retrofitted worldwide.**

Examples include:
- Two units in Argentina
- One unit in Australia
- Five units in Belgium
- One unit in the Netherlands

In the USA Siemens has successfully implemented the first set of Siemens innovative 3D optimized blades and vanes for turbine stages 1 and 2 in the SGT6-2000E (V84.2) gas turbine in March 2009.

Siemens has successfully implemented Siemens innovative 3D optimized blades and vanes for turbine stages 1 to 4 in a SGT5-2000E (V94.2) gas turbine in Australia in 2008.
