

# Creating value for a sustainable energy system

A powerful step into the future – Siemens Energy Value Charter

---

**Climate change is real.** It threatens our very existence on this planet. One thing is encouraging, though: The international community agrees that we must follow the Paris climate goals. **Siemens is leading by example.**

**We walk the talk** and are already taking steps towards achieving our goal to be a carbon neutral business by 2030. In addition, we are enabling our customers to reduce their CO<sub>2</sub> emissions.

Drawing on our years of experience with partners, **we have developed a holistic approach** to exchange with governments and customers around the world – namely, our **Siemens Energy Value Charter.**

---

---

# The Energy Value Charter calls for **3 key priorities** for developing the **sustainable energy systems** of the future – worldwide

---

## 1 Secure a reliable, affordable and sustainable energy generation

Reliable access to sustainable electricity is the basis for economic growth today and in the future. To achieve this, we need a mix of renewable energy from wind and other sources, efficient and highly flexible power plant technologies as well as storage and optimized demand-management systems.

## 2 Deliver efficient, safe and future-oriented infrastructure

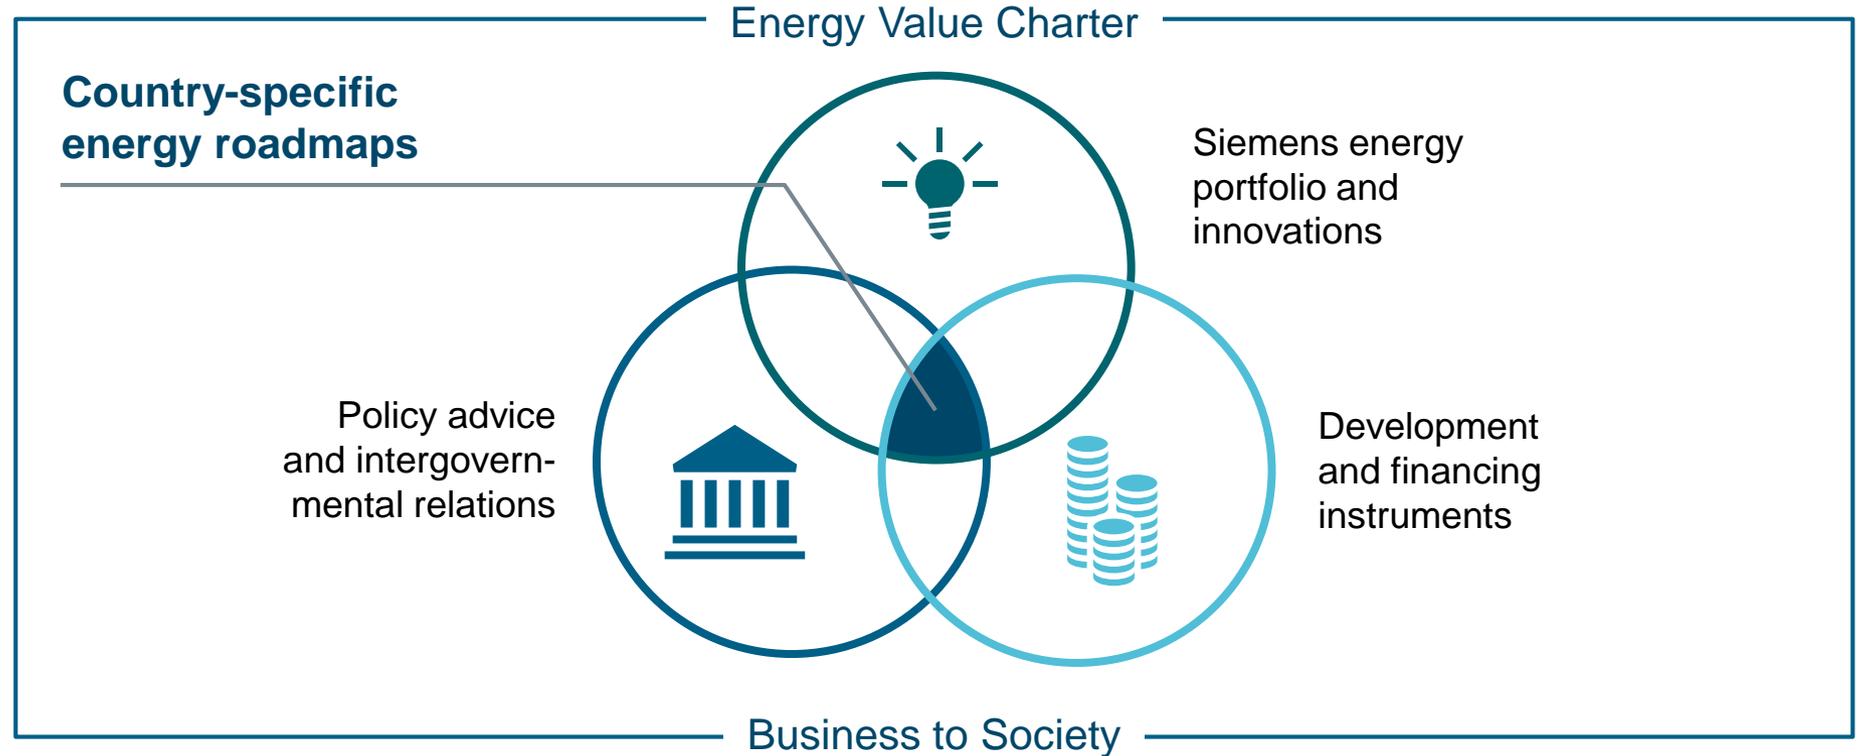

Transporting and integrating sustainable energy into our economy requires intelligent and cross-sector solutions. Electricity, gas and digital infrastructures must fit the purpose and be fully integrated. Power-to-X is the missing link for sectorial integration.

## 3 Empower energy users

More diversity, falling costs and new digital technologies empower consumers to play an active part in shaping the future energy systems. This creates new possibilities around-the-meter as well as for decentralized efficient energy systems.

## The lever

Our Energy Value Charter is the lever for country-specific energy roadmaps

Siemens can offer **unique tailor-made energy roadmaps** and drive **Business to Society** for every country in the world

With the Energy Value Charter

# Siemens is the trusted partner for sustainable energy systems.

We invite governments and partners around the world to engage in dialogue on how energy systems can be designed to become a strong backbone for sustainable economic growth.
