

# FEED Study for energy transition

Engineering study to shape individual energy transition roadmap

## Product Overview

- Consultive approach delivering a roadmap with steps for the short-, mid- and long-term to economically achieve sustainability targets

## Improved Features

- Process expertise leading to a customized approach, focusing on technical actions needed to achieve committed targets;
- Development of concepts based on Siemens Energy portfolio, including CAPEX OPEX estimate, project schedule and investment per carbon dioxide equivalent reduction
- Project includes assessments on the asset to evaluate areas of improvement

## Benefits

- Increased energy efficiency
- Emission reduction
- Process consumables reduction
- Visibility of your decarbonization target – feasibility, required investment, schedule, technologies involved, etc;
- Process understanding → Asset Mapping enables the identification of gaps and opportunities to decarbonize;
- Positioning of your company as a decarbonization player.
- Optimize investment to maximize emission reduction;

## Scope of work & Implementation

- Roadmap for customers in various industries and regions.
